

1. Executive Summary

Booze App is a hyper-local, two-sided marketplace designed to streamline 18+ beverage delivery for consumers while serving as an essential business management tool for local liquor vendors. The Minimum Viable Product (MVP) focuses on a confined geographic radius to validate the business model without excessive operational overhead. It prioritizes frictionless catalog management, automated bookkeeping, and simplified in-house dispatch over complex third-party logistics.

2. Target Personas

The Consumer

Local residents and students (18+) within Gwallameji seeking fast, reliable delivery of alcoholic beverages for personal consumption or events. They value quick visual browsing, transparent pricing, and accurate delivery ETAs without leaving their lodges or homes.

The Vendor / Store Owner

Local liquor shop owners transitioning from manual bookkeeping. They require a low-friction method to digitize their inventory, track daily profit margins, and manage their own delivery staff without learning a complicated new software system.

3. Scope & Constraints

- **Geographic Geo-Fence:** Strictly confined to the Gwallameji axis in Bauchi for the initial phase to ensure dense order volume and manageable delivery times.
- **Logistics constraint:** No third-party rider network will be built for the MVP. Delivery is executed entirely by the vendor's existing internal staff.
- **Platform architecture:** Mobile-first web app (PWA) or cross-platform mobile app (React Native/Flutter) to ensure rapid deployment and low barrier to entry for both consumers and vendors.

4. Functional Requirements

4.1 Consumer-Facing App Features

Feature	Description	Priority
Age Verification Gate	Mandatory 18+ DOB entry screen upon app launch. Blocks access to underage users to ensure strict legal compliance.	P0
Localized Browsing	Homepage displaying distinct categories (Beers, Spirits, Wines, Mixers) available strictly from the local Gwallameji vendor's active stock.	P0
Cart & Checkout	Seamless cart management with fixed or dynamically calculated delivery fees based strictly on the Gwallameji community radius.	P0
Address & Pin Drop	Google Maps API integration allowing users to drop a precise pin for their home address, student lodge, or hostel.	P0
Order Tracking	Simple status updates displayed to the user (Pending, Packed, Out for Delivery, Delivered) triggered by the vendor.	P1

5. Design & UI/UX Guidelines

- Consumer App Aesthetics:** Default to dark mode to evoke a premium, nightlife-adjacent feel. Design should heavily rely on large, crisp product imagery and bold typography to make browsing effortless.
- Vendor Dashboard Architecture:** Requires strict visual hierarchy. The backend must utilize a scalable design system (leveraging fluid grids and Auto Layout components) so that complex tables for bookkeeping and inventory tracking remain highly legible on mobile screens and tablets.
- Micro-Interactions:** Provide clear, satisfying feedback loops when a vendor updates stock counts, or when a consumer successfully drops a location pin (e.g., haptic feedback, success toasts).

4.2 Vendor Management Dashboard (Backend)

Feature	Description	Priority
Global Product Catalog	A pre-populated database of popular beverage brands with high-quality default images. Vendors simply select items to add to their active inventory.	P0
Custom Item Upload	Ability to take a photo, set a price, and add unique or niche local stock not found in the global catalog.	P0
Inventory Alerts	Digital stock counting. The system automatically deducts units upon sale and triggers "Low Stock" visual flags in the dashboard.	P0
Bookkeeping Digest	A daily automated ledger showing Total Sales, Cost of Goods Sold (COGS), and Net Profit to provide immediate business value.	P0
One-Click Dispatch	A single button that extracts the customer's order, phone number, and Google Maps pin, formatting it into a WhatsApp message sent directly to the vendor's delivery staff.	P1

6. Success Metrics (KPIs for MVP)

Vendor Onboarding Time Time taken for a vendor to fully stock their digital storefront. Target: < 15 minutes utilizing the global catalog.	Operational Efficiency Average delivery completion time within the Gwallameji geo-fence from order acceptance to drop-off.
Dashboard Engagement Percentage of active vendors logging into the bookkeeping/digest dashboard daily.	Customer Retention Customer repeat order rate week-over-week within the launch zone.

7. Future Scope (Post-MVP)

- Expansion into broader Bauchi neighborhoods (e.g., Yelwa, GRA) and enablement of multi-vendor browsing for users.
- Integration with dedicated third-party logistics (3PL) APIs to handle delivery spikes if vendor order volume exceeds their internal staff capacity.
- Implementation of customer loyalty points, wallet funding, and referral programs to drive viral growth.
